# Plug Loads and Tenant Energy Use Reduction

## A guide to saving energy in tenant occupied spaces.

tech overview

applicable building types  
multifamily and commercial

when to implement  
anytime; at tenant turnover

fast facts

- reduces energy use
- reduces GHG emissions
- improves tenant experience
- encourages energy reduction
- reduces utility costs

costs & benefits\*

GHG Savings

Tenant Experience Improvements

Utility Savings

Capital Costs

Maintenance Requirements

\*ratings are based on system end use, see back cover for details.

## understanding plug loads and tenant energy use

Energy use in tenant spaces can be significantly reduced by adopting simple user engagement strategies, upgrading to efficient appliances and equipment, sub-metering tenant spaces, and installing smart lighting controls.

### how tenants use energy

Plug loads refer to the amount of energy used through electrical outlets for things like electronics and appliances in tenant-occupied spaces that, along with lighting and other energy consuming equipment used by tenants, add up to a significant portion of electricity use in buildings, especially commercial offices.

Many opportunities to reduce plug loads and tenant energy use are relatively low-cost but require increased coordination and engagement with tenants. Combining inexpensive technology upgrades with tenant education and behavior change can help reduce energy use in both multifamily and commercial spaces.

During tenant turnovers, incorporating energy conservation practices into lease language helps establish energy use expectations. Educating tenants on efficiency best practices gives them the tools to reduce energy use and can create advocates within a building or occupant group. Tenants participating in plug load and energy use reduction programs may also be more receptive to other energy improvements and technology investments.

Installing sub-meters and tracking energy consumption in tenant spaces can increase tenant

motivation to improve efficiency by revealing how and when energy is used. Data sharing allows tenants to track energy use over time and witness the success of efficiency improvements. Although not part of LL88, it is best practice to install sub-meters for residential tenants as well.

Technology improvements that further reduce plug loads include upgrading appliances and equipment to high-efficiency models and installing vacancy sensors or timers on lighting and equipment (see the *LED Lighting Tech Primer* for more information on lighting retrofits).

Lighting vacancy sensors save energy by turning off lights automatically when rooms are empty.

#### **Assess**

Always consult a qualified service provider before undertaking any building upgrades.

#### **Upgrade Electrical Service For Future Improvements**

Upgrading a tenant's electrical service to 201/230 volts should be conducted when installing electricity sub-meters.

*Upgrading voltage enables future energy efficiency and electrification upgrades.*

#### **Engage and Educate Tenants**

Engaging tenants in a plug load reduction strategy may be a significant departure from the normal landlord-tenant relationship. Consider setting up a tenant association that can evaluate how to implement energy conservation efforts.

*To avoid resistance, engage with each occupant group individually.*

## how to reduce plug loads and tenant energy use

Tenant education and energy conservation programs can begin anytime, whereas equipment, appliance, and control upgrades are best implemented during tenant turnovers.

### reduction strategies:

Consider taking the following steps to reduce plug loads and tenant energy use:

#### **A** Commercial Strategies

##### **1. Install sub-meters with feedback to tenants:**

Sharing metered energy data can encourage tenants to conserve energy.

- Create an online portal or install a flat panel monitor in each tenant's lobby to give occupants a view of their energy use. With granular information such as daily summaries or real-time energy use data, occupants can see where and how they use energy.
- Create friendly competitions to encourage energy reduction by comparing a tenant's energy use data to others in the building, or to similar spaces in other buildings, to show tenants if they are high energy users.

**2. Install vacancy sensors:** Program vacancy sensors with controls to turn off lights and appliances when spaces are not in use, especially overnight or after office hours.

##### **3. Use ENERGY STAR-certified appliance:**

Upgrade office equipment such as computers, printers, and TVs, as well as refrigerators, microwaves, coffee machines, and other appliances to ENERGY STAR-certified models.

**4. Include Power Usage Effectiveness in lease documents:** For commercial leases with IT infrastructure, include requirements for Power Usage Effectiveness (the ratio that describes the efficiency of a computer data center) and encourage waste heat recovery.

##### **5. Encourage tenants to:**

- Use the resources available at the [ENERGY STAR Bring Your Green to Work](#) website.
- Use timers on appliances that are not in use overnight, such as water heaters.
- Use energy saving settings on computers.

- Use window shades to reduce solar heat gain and cooling loads
- Install signs or other simple communications that remind tenants to turn off lights, computers, and HVAC units when not in use.

#### **B** Multifamily Strategies

**1. Install sub-meters:** It is best practice to sub-meter each apartment, as tenants who pay for electricity tend to be more motivated to reduce their energy use.

- If billing tenants for electricity is not desirable, sub-metering without billing can still encourage energy conservation. With the right messaging, each resident can contribute towards reducing overall building energy use. Refer to the [ENERGY STAR](#) website for communication and messaging strategies.

##### **2. Use ENERGY STAR-certified appliances–**

Replace old appliances with high-efficiency models. Upgrading refrigerators, microwaves, and dishwashers to ENERGY STAR-certified appliances can greatly reduce energy use.

- In buildings where tenants own appliances, coordinate a bulk purchase to reduce the per-unit cost and comprehensively upgrade all appliances to efficient models.

**3. Install high-efficiency electric stoves:** Replace electric coil stoves, including infrared cooktops, with more efficient induction cooktops.

- Where gas stoves exist, make sure apartment electricity service is 208/230V and switch to electric induction cooktops and ovens.

##### **4. Encourage tenants to:**

- Use the resources available at the [ENERGY STAR Live Green at Home](#) website.
- Deactivate power strips and electronics, and turn off routers, cable boxes, coffee machines, and televisions when not in use.

# costs & benefits of reducing plug loads\*

## Greenhouse Gas (GHG) Savings

Depending on a building's baseline energy use, plug load reductions can significantly lower electricity-related GHG emissions without compromising tenant experience.

## Tenant Experience Improvements

Upgrading appliances to more efficient models improves tenant experience, and removing gas appliances from apartments reduces fire risk and harmful combustion products from the air. Saving energy can make a tenant feel empowered and more satisfied with the building they work or live.

## Utility Savings

If the building is submetered, owners will see little change in utility bills, as most utility savings will appear on tenant bills.

## Capital Costs

A small capital investment is required for installing sub-metering, appliance upgrades, and other plug load reduction strategies.

## Maintenance Requirements

Regular engagement with tenants may improve how building staff executes operations and maintenance tasks. Occupants can tip off staff to maintenance issues and reduce repair costs and downtime.

\*The Costs & Benefits rating system is based on a qualitative 1 to 4 scale where 1 (lowest) is lowest and 4 (highest) is highest. Green correlates to savings and improvements, orange correlates to costs and requirements. Ratings are determined by industry experts and calculated relative to the system end use, not the whole building.

Note: Most utility cost savings will be on tenant bills unless the building is master metered.

## take action

This document is one of more than a dozen High Performance Technology Primers prepared by Building Energy Exchange and its partners to introduce decision-makers to solutions that can help them save energy and improve comfort in their buildings. ## building energy exchange st. louis

Building Energy Exchange St. Louis (BE-Ex STL) advances building energy performance by mobilizing the professional expertise, funding, and technical resources needed to reduce the energy required to power our buildings. In coordination with public, private, non-profit, and community stakeholders, BE-Ex STL expands our region's capacity to increase affordability, improve the health of our community, and position St. Louis as a resilient and carbon neutral region.

LinkedIn: [linkedin.com/company/building-energy-exchange-st-louis](https://www.linkedin.com/company/building-energy-exchange-st-louis/)

## building energy exchange

The Building Energy Exchange (BE-Ex), located in New York City, has served as a trusted resource for the real estate, design, and construction industries for over a decade. BE-Ex supports the growth of centers of excellence across the country dedicated to reducing the effects of climate change by improving the built environment.

Launched in Spring 2021, BE-Ex STL will utilize the deep resources and expertise of BE-Ex in New York, while also creating a customized approach to services and programs in our city.

Call: (212) 349-3900
